INTRODUCTION

Project background and context

Space X advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, much of the savings is because Space X can reuse the first stage. Therefore, if we can determine if the first stage will land, we can determine the cost of a launch. This information can be used if an alternate company wants to bid against space X for a rocket launch. The project aims to create a machine learning pipeline to predict if the first stage will land successfully.

- Problems you want to find answers
 - What factors determine if the rocket will land successfully?
 - The interaction amongst various features that determine the success rate of a successful landing.
 - What operating conditions need to be in place to ensure a successful landing program.

IBM Developer

SKILLS NETWORK

METHODOLOGY

Executive Summary

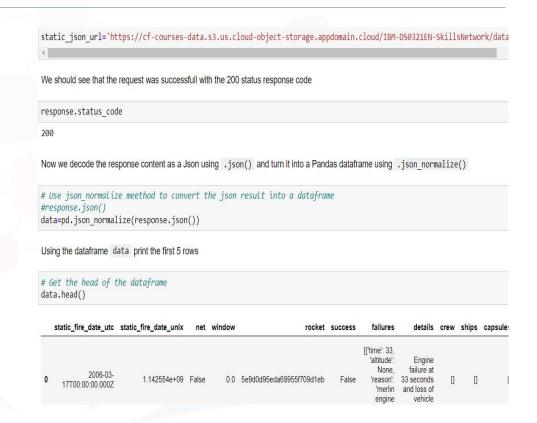

- Data collection methodology:
 - Data was collected using SpaceX API and web scraping from Wikipedia.
- Perform data wrangling
 - One-hot encoding was applied to categorical features
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
 SKILLS NETWORK

Data Collection – SpaceX API

 We used the get request to the SpaceX API to collect data, clean the requested data and did some basic data wrangling and formatting.

Data Collection –Web Scrapping

- We applied web scrapping to web scrap Falcon 9 launch records with BeautifulSoup
- We parsed the table and converted it into a pandas data frame.

```
# use requests.get() method with the provided static_url
response=requests.get(static_url).text
# assign the response to a object

Create a BeautifulSoup object from the HTML response

# Use BeautifulSoup() to create a BeautifulSoup object from a response text content
soup = BeautifulSoup(response, "html.parser")

Print the page title to verify if the BeautifulSoup object was created properly

# Use soup.title attribute
for link in soup.find_all('a',href=True): # in html anchor/link is represented by the tag <a>
print(link.get('href'))</a>
```

```
html_tables=soup.find_all('table')
```

Starting from the third table is our target table contains the actual launch records.

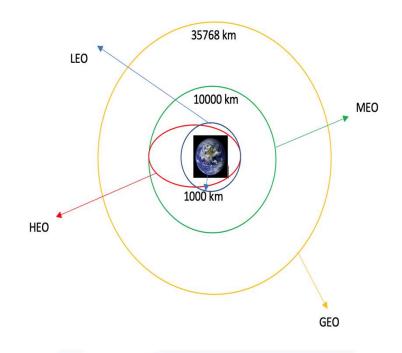

```
# Let's print the third table and check its content
first_launch_table = html_tables[2]
```

Data Wrangling

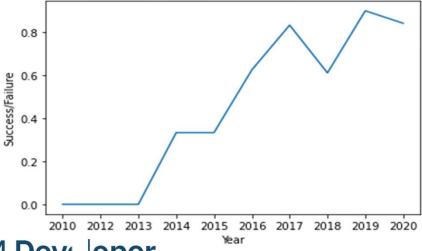

- We performed exploratory data analysis and determined the training labels.
- We calculated the number of launches at each site, and the number and occurrence of each orbit
- We created a landing outcome label from the outcome column and exported the results to CSV.

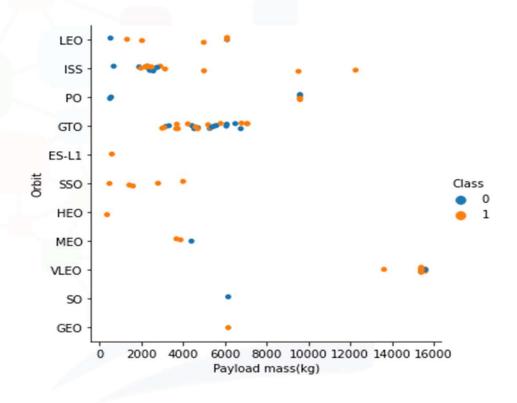

EDA with Data Visualization

 We explored the data by visualizing the relationship between flight number and launch Site, payload and launch site, the success rate of each orbit type, flight number and orbit type, and the launch success yearly trend.

IBM Developer

SKILLS NETWORK

Build an Interactive Map with Folium

- We marked all launch sites and added map objects such as markers, circles, and lines to mark the success or failure of launches for each site on the folium map.
- We assigned the feature launch outcomes (failure or success) to classes 0 and 1. i.e., 0 for failure, and 1 for success.
- Using the color-labeled marker clusters, we identified which launch sites have a relatively high success rate.
- We calculated the distances between a launch site to its proximities. We answered some questions for instance:
 - Are launch sites near railways, highways, and coastlines.
 - Do launch sites keep a certain distance away from cities.

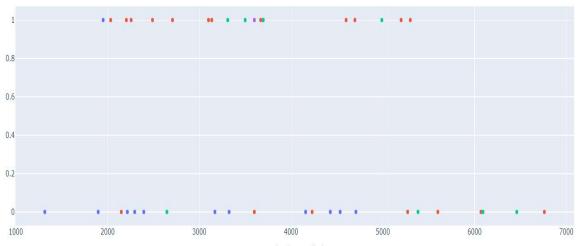

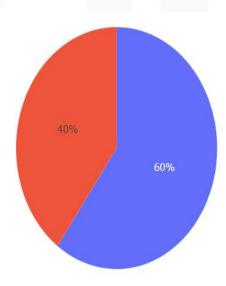

Build a dashboard with plotly

- · We built an interactive dashboard with Plotly dash
- We plotted pie charts showing the total launches by a certain sites
- We plotted a scatter graph showing the relationship between Outcome and Payload Mass (Kg) for the different booster versions.

Predictive Analysis (Classification

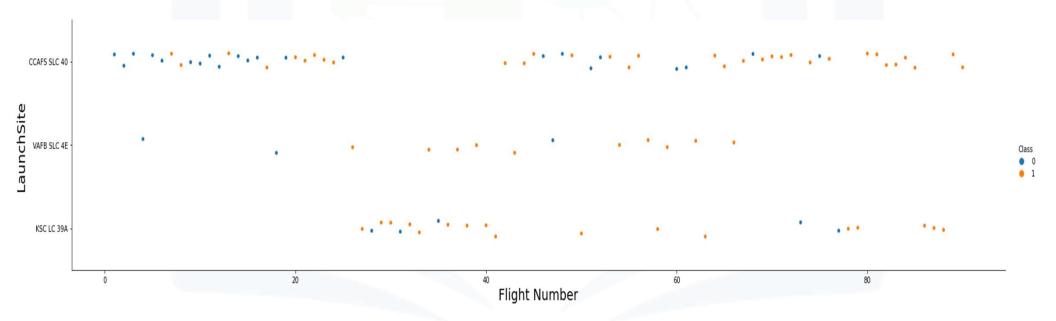

- We loaded the data using NumPy and pandas, transformed the data, and split our data into training and testing.
- We built different machine learning models and tune different hyperparameters using GridSearchCV.
- We used accuracy as the metric for our model and improved the model using feature engineering and algorithm tuning.
- We found the best-performing classification model.

Results

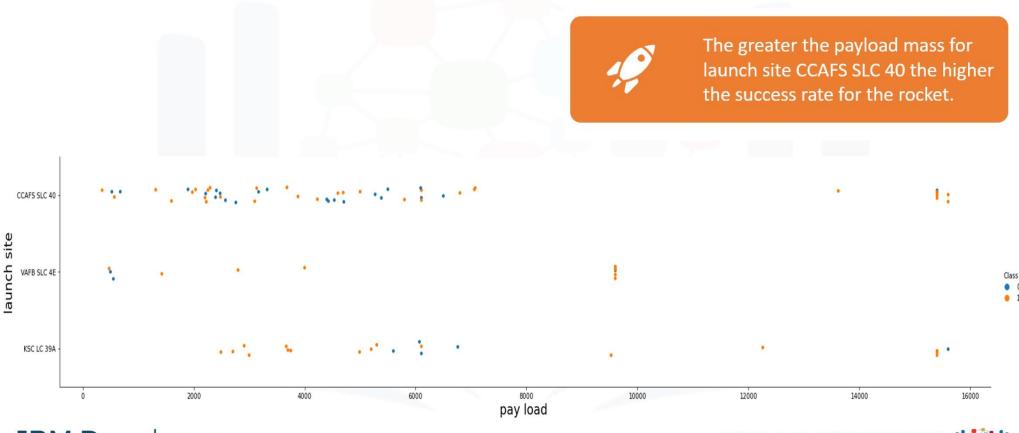

Flight number vs Launch site

From the plot, we found that the larger the flight amount at a launch site, the greater the success rate at a launch site.

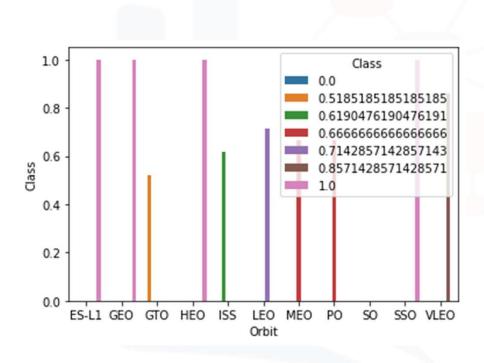

Payload vs Launch site

Success Rate vs. Orbit Type

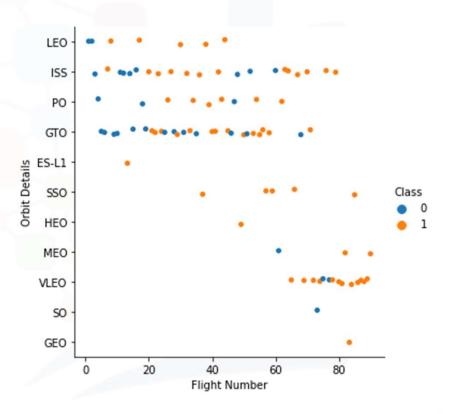

From the plot, we can see that ES-L1, GEO, HEO, SSO, VLEO had the most success rate.

Flight Number vs. Orbit Type

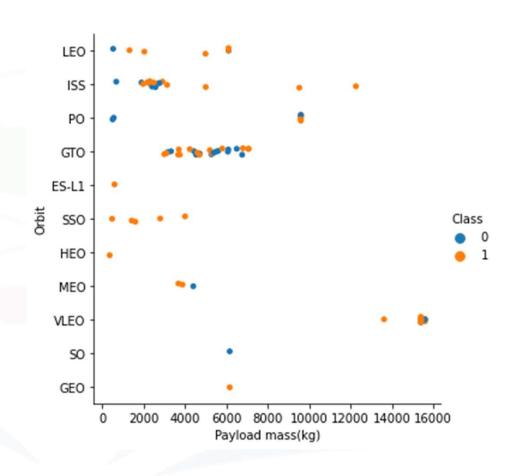

The plot here shows the Flight Number vs. Orbit type. We observe that in the LEO orbit, success is related to the number of flights whereas, in the GTO orbit, there is no relationship between flight number and the orbit.

Payload vs. Orbit Type

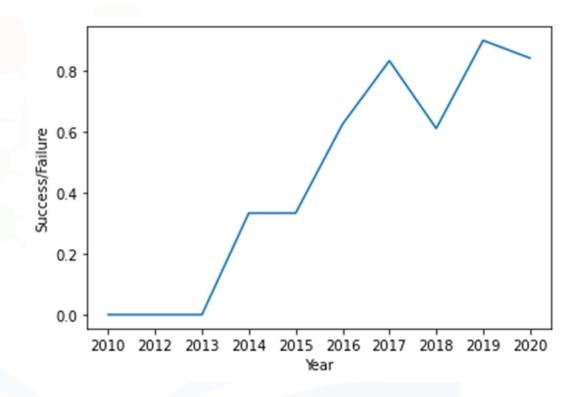

We can observe that with heavy payloads, the successful landing is more for PO, LEO, and ISS orbits.

Launch Success Yearly Trend

From the plot, we can observe that the success rate since 2013 kept on increasing till 2020.

All Launch Site Names

 We used the key word DISTINCT to show only unique launch sites from the SpaceX data.

Display the names of the unique launch sites in the space mission

```
Out[10]: launchsite

0 KSC LC-39A

1 CCAFS LC-40

2 CCAFS SLC-40

3 VAFB SLC-4E
```

Launch Site Names Begin with 'CCA'

Display 5 records where launch sites begin with the string 'CCA'

In [11]:	Co	FROM WHER LIMI	ECT * 1 SpaceX RE Launc IT 5	hSite LIKE 'CC							
Out[11]:		date	time	boosterversion	launchsite	payload	payloadmasskg	orbit	customer	missionoutcome	landingoutcome
	0	2010-04- 06	18:45:00	F9 v1.0 B0003	CCAFS LC- 40	Dragon Spacecraft Qualification Unit	0	LEO	SpaceX	Success	Failure (parachute)
	1	2010-08-	15:43:00	F9 v1.0 B0004	CCAFS LC-	Dragon demo flight C1, two CubeSats, barrel	0	LEO	NASA (COTS)	Success	Failure

Dragon demo flight C2

3	10	00:35:00	F9 v1.0 B0006	40	SpaceX	CRS-1	500	(ISS)	NASA (CRS)	Success	No attempt

 We used the query above to display 5 records where launch sites begin with `CCA`

No attempt

NASA (COTS)

Success

Total Payload Mass

 We calculated the total payload carried by boosters from NASA as 45596 using the query below

```
Display the total payload mass carried by boosters launched by NASA (CRS)
```

Average Payload Mass by F9 v1.1

 We calculated the average payload mass carried by booster version F9 v1.1 as 2928.4 Display average payload mass carried by booster version F9 v1.1

Out[13]: avg_payloadmass
0 2928.4

First Successful Ground Landing Date

 We observed that the dates of the first successful landing outcome on ground pad was 22nd December 2015

Successful Drone Ship Landing with Payload between 4000 and 6000

 We used the WHERE clause to filter for boosters which have successfully landed on drone ship and applied the AND condition to determine successful landing with payload mass greater than 4000 but less than 6000

Out[15]:		boosterversion
	0	F9 FT B1022
	1	F9 FT B1026
	2	F9 FT B1021.2
	3	F9 FT B1031.2

Total Number of Successful and Failure Mission Outcomes

List the total number of successful and failure mission outcomes

```
In [16]:
          task_7a = '''
                  SELECT COUNT(MissionOutcome) AS SuccessOutcome
                  FROM SpaceX
                  WHERE MissionOutcome LIKE 'Success%'
          task 7b = '''
                  SELECT COUNT(MissionOutcome) AS FailureOutcome
                  WHERE MissionOutcome LIKE 'Failure%'
          print('The total number of successful mission outcome is:')
          display(create pandas df(task 7a, database=conn))
          print('The total number of failed mission outcome is:')
          create pandas df(task 7b, database=conn)
          The total number of successful mission outcome is:
            successoutcome
                      100
         The total number of failed mission outcome is:
Out[16]:
            failureoutcome
```

 We used wildcard like '%' to filter for WHERE MissionOutcome was a success or a failure.

Boosters Carried Maximum Payload

 We determined the booster that have carried the maximum payload using a subquery in the WHERE clause and the MAX() function. List the names of the booster_versions which have carried the maximum payload mass. Use a subquery

```
In [17]:

task_8 = '''

SELECT BoosterVersion, PayloadMassKG
FROM SpaceX
WHERE PayloadMassKG = (
SELECT MAX(PayloadMassKG)
FROM SpaceX
)

ORDER BY BoosterVersion

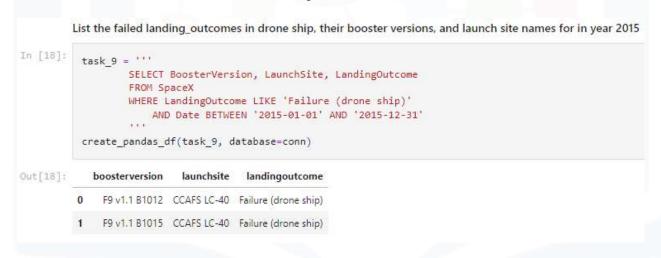

create_pandas_df(task_8, database=conn)
```

Out[17]: boosterversion payloadmasskg F9 B5 B1048.4 15600 F9 B5 B1048.5 15600 F9 B5 B1049.4 15600 F9 B5 B1049.5 15600 F9 B5 B1049.7 15600 F9 B5 B1051.3 15600 F9 B5 B1051.4 15600 F9 B5 B1051.6 15600 F9 B5 B1056.4 15600 F9 B5 B1058.3 15600 F9 B5 B1060.2 15600 F9 B5 B1060.3 15600

2015 Launch Records

• We used a combinations of the WHERE clause, LIKE, AND, and BETWEEN conditions to filter for failed landing outcomes in drone ship, their booster versions, and launch site names for year 2015

Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad))

```
In [19]:
    task_10 = '''
        SELECT LandingOutcome, COUNT(LandingOutcome)
        FROM SpaceX
        WHERE DATE BETWEEN '2010-06-04' AND '2017-03-20'
        GROUP BY LandingOutcome
        ORDER BY COUNT(LandingOutcome) DESC
        '''
    create_pandas_df(task_10, database=conn)
```

landingoutcome	count
No attempt	10
1 Success (drone ship)	6
2 Failure (drone ship)	5
3 Success (ground pad)	5
4 Controlled (ocean)	3
5 Uncontrolled (ocean)	2
6 Precluded (drone ship)	1
7 Failure (parachute)	1
	Success (drone ship) Failure (drone ship) Success (ground pad) Controlled (ocean) Uncontrolled (ocean) Precluded (drone ship)

- We selected Landing outcomes and the COUNT of landing outcomes from the data and used the WHERE clause to filter for landing outcomes BETWEEN 2010-06-04 to 2010-03-20.
- We applied the GROUP BY clause to group the landing outcomes and the ORDER BY clause to order the grouped landing outcome in descending order.

All launch sites global map markers

Markers showing launch sites with color labels

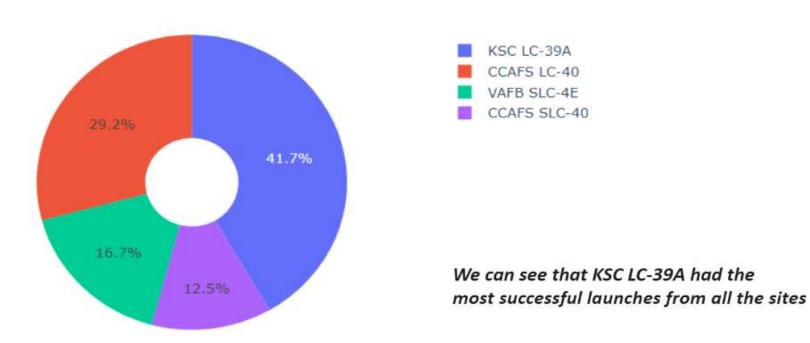

Launch Site distance to landmarks

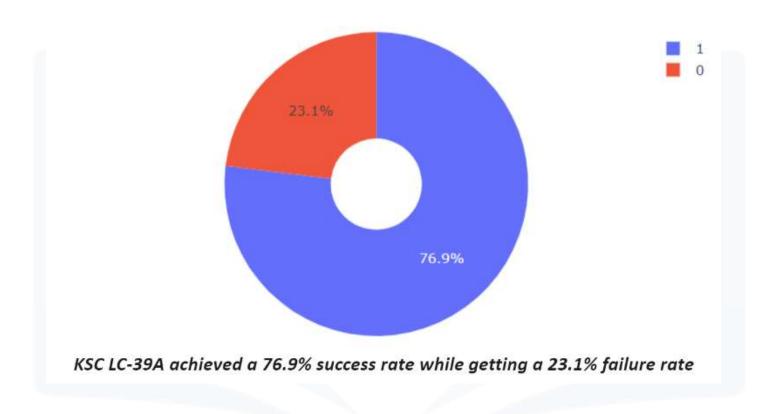

Pie chart showing the success percentage achieved by each launch site

Total Success Launches By all sites

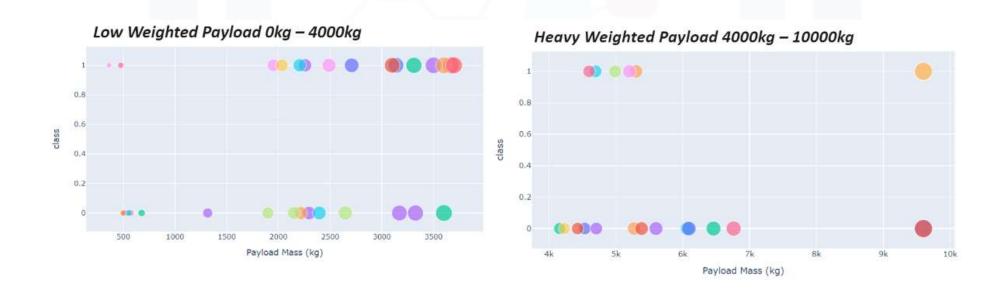

Pie chart showing the Launch site with the highest launch success ratio

Scatter plot of Payload vs Launch Outcome for all sites, with different payload selected in the range slider

We can see the success rates for low weighted payloads is higher than the heavy weighted payloads

Classification Accuracy

 The decision tree classifier is the model with the highest classification accuracy

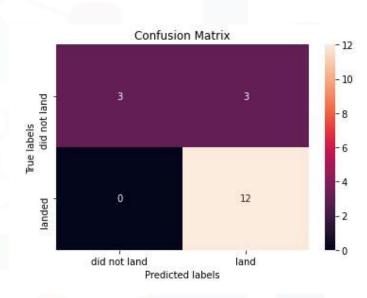

Best model is DecisionTree with a score of 0.8732142857142856

Best params is : {'criterion': 'gini', 'max_depth': 6, 'max_features': 'auto', 'min_samples_leaf': 2, 'min_samples_split': 5, 'splitter': 'random'}

Confusion Matrix

 The confusion matrix for the decision tree classifier shows that the classifier can distinguish between the different classes.
 The major problem is the false positives. i.e., an unsuccessful landing is marked as a successful landing by the classifier.

CONCLUSION

We can conclude that:

- The larger the flight amount at a launch site, the greater the success rate at a launch site.
- Launch success rate started to increase in 2013 till 2020.
- Orbits ES-L1, GEO, HEO, SSO, and VLEO had the most success rate.
- KSC LC-39A had the most successful launches of any site.
- The Decision tree classifier is the best machine learning algorithm for this task

THANK YOU!
